

CLAIMS

What is claimed is:

1. A programming tool for programming a first computing device comprising a first table having a first plurality of configuration states, at least one of said configuration states defining one or more qualifying conditions;

a second table specifying a second plurality of paths, at least one of said paths being executed when a qualifying condition listed in said first table is satisfied; and one of said configuration states being specified as an active state; characterized in that said tool further comprises one or more of the following elements or characteristics:

(1) at least one of said configuration state comprising a virtual qualifier;

(2) at least one of said second plurality of paths having one or more labels, wherein each label represents an executable program;

(3) one or more further tables specifying user-defined custom expressions to represent corresponding predefined instructions of a programming language;

(4) said first computing device being a remote computer connecting to a second local computing device through a communication link; wherein the digital data representing said first and second tables is stored in said remote computing device for downloading to said local computing device through said communication link;

(5) said first computing device comprising at least a first processor and a second processor; wherein said first processor is configured to translate the relationship between said first and second tables and to give direction to the second processor to execute other programs;

(6) at least one of said configuration states comprising a label and said label being equated with a separate expression defining the qualifying condition represented by said label;

(7) a table defining a preferable style of keywords;

(8) a table having a third plurality of task states to define the activity of a fourth plurality of tasks;

(9) a table defining a fifth plurality of output expressions, each output expression representing an output condition of a configuration state or a path element listed in said second table.

1 (10) a further state table defining a sixth plurality of configuration states and a
2 further path table defining a seventh plurality of paths; wherein said first and second
3 tables are grouped as a first table group to perform a first function, said further state and
4 path tables are grouped as a second table group to perform a different second function.

5
6 2. The programming tool of claim 1 wherein said tables and/or elements are
7 configured by a programmer in accordance to a preprogram objective, and to be
8 translated into a program executable by said computing device to deliver said preprogram
9 objective.

10
11 3. The programming tool of claim 1 wherein said programming tool comprises a
12 third computing device having a table format compiler configured to compile a table
13 format program input into said third computing device to generate codes executable by
14 said first computing device.

15
16 4. A computing program configured by a programmer in accordance to a predefined
17 programming objective for executing by a computing device to deliver said programming
18 objective comprising a first table having x configuration states, at least one of said
19 configuration states is configured to define one or more qualifying conditions;

20 a second table specifying y paths, at least one of said paths is executed by said
21 computing device when a qualifying condition enlisted in said first table is satisfied; said
22 program further comprising at least one of the following tables:

23 (1) a table specifying user defined custom expressions to equate the
24 corresponding predefined instructions of a programming language;

25 (2) a table defining preferable style of keywords;

26 (3) a table having m task states to define the activity of n tasks, at least one of
27 said task states specifies k selected tasks to be active;

28 (4) a table having p task states to define q tasks, at least one of said task states
29 specifies the priority of the active tasks to be serviced;

30 (5) a table defining x qualifying expressions, each qualifying expression
31 represents a qualifying condition of a configuration state; and

1 (6) a table defining y output expressions, each output expression represent an
2 output condition of a configuration state or a path element enlisted in said second table.

3
4 5. The computer program of claim 4 further be compiled into data executable by
5 said computing device, and to be stored in memory means configured to store digital
6 data.

7
8 6. The computer program of claim 5 further be embedded in said computing device
9 wherein said computing device is installed in an article of sale.

10
11 7. A programming method to program a computing device responsive to one or
12 more predefined qualifying conditions, to execute one or more paths and to direct said
13 computing device to perform in accordance to the objective of said paths; said
14 programming method comprises the steps of:

15 (1) specify x configuration states;

16 (2) specify one or more qualifying conditions to at least one of said x
17 configuration states,

18 (3) specify y paths to be executed by said computing device;

19 (4) assign z labels to represent one or more of the path elements of step (3)
20 wherein z is an integer equal or greater than one;

21 (5) for each qualifying condition of step (2), specify a path of step (3) to be
22 executed by said computing device when a specific qualifying condition is satisfied;

23 (6) specify at least one of the configuration states to become the active
24 configuration state;

25 (7) for each assigned label of step (4), define an executable program to be
26 represented by said label.

27
28 8. The programming method of claim 7 wherein the label of step (4) is not initially
29 executable by said computing device and the additional step (7) is configured to enable
30 the execution of said label by said computing device.

31

1 9. The programming method of claim 8 further comprising a step to identify a label
2 not executable by said computing device for the composing of the program of step (7)
3 thereof.

4
5 10. The programming method of claim 7 wherein the program of step (7) is composed
6 by any available programming languages including the table format programming
7 language.

8
9 11. The programming method of claim 10 further comprising a step to define means
10 to pass parameters between the program represented by the steps (1) to (6) and the
11 executable program represented by the label.

12
13 12. The programming method of claim 7 further comprising a step to specify one or
14 more output conditions to at least one of said x configuration states.

15
16 13. The programming method of claim 7 wherein at least an output condition is
17 specified in a path or in a configuration state.

18
19 14. The programming method of claim 7 further comprising a step to specify
20 resources of said computing device required to service the states and paths thereof.

21
22 15. The programming method of claim 7 further comprising a step to indicate the
23 resources of said computing device available for composing the program of step (7).

24
25 16. The programming method of claim 7 wherein said computing device comprises of
26 two or more processors; the resources to service the states and paths specified are
27 provided by a first processor and at least part of the program of step (7) is serviced by the
28 resources of a second processor.

29
30 17. The programming method of claim 7 wherein said computing device is defined as
31 a first computing device; said programming method further comprising a step to receive

1 digital data representing the aforementioned steps through a communication link from a
2 second computing device locating remote from said first computing device.

3
4 18. The programming method of claim 7 wherein at least part of said steps are
5 organized into a table format.

6
7 19. The programming method of claim 18 further comprising a step to group the
8 configurations states of step (1) and (2) into one or more tables.

9
10 20. The programming method of claim 18 wherein the configuration states or paths
11 are not necessary to be enlisted in sequential relationship to each other.

12
13 21. The programming method of claim 7 further comprising a step to transform the
14 specifications of the configuration states and the paths into digital data to be stored into
15 said computing device for the execution thereof.

16
17 22. The programming method of claim 7 further comprising a step to transform at
18 least part of the specification of said steps with a secondary programming language of
19 different format.

20
21 23. The programming method of claim 7 further comprising a step to identifying the
22 location of the program composed by said steps.

23
24 24. The programming method of claim 10 wherein the program of step (7) is a
25 program locates external to the program composed by the steps of claim 1.

26
27 25. The programming method of claim 24 further comprising a step to identify the
28 location of said external program.

29

26. The programming method of claim 7 further comprising a step to organize a separated table to specify if the program composed by steps (1) to (7) is active or not active.

27. The programming method of claim 7 further comprising a step to assign a label to represent a configuration state.

28. The programming method of claim 7 further comprising a step to assign a label to represent a path.

29. A programming method to program a computing device executing multiple programs, at least one of said program is composed in accordance to a first predefined pre-computer objective, and to direct said computing device to perform according to said predefined first objective, said programming method comprises the steps of:

- (1) specify n programs executable by said computing device;
- (2) define m task states, each task state specifies k selected programs to be active, wherein k is an integer equal or greater than zero; and
- (3) specify one of the task states of step (2) to be the active task state.

30. The programming method of 29 wherein at least one of the programs is a table format program comprising:

- x program configuration states, at least one of said configuration states defines one or more qualifying conditions;
- y paths to be executed by said computing device; and
- one of said paths is executed by said computing device when a specific qualifying condition is satisfied.

31. The programming method of claim 29 wherein the programs of step (1) are of different languages.

32. The programming method of claim 29 further comprising a step to provide a keyword to represent the steps (1) to (3).

33. The programming method of claim 29 wherein said task states are not necessary to be listed in sequential relationship to each other.

34. The programming method of claim 29 wherein the steps (1) to (3) define a first task table, said programming method further comprising steps to define a second different task table.

35. A programming method to program a remote computing device in accordance to a first predefined pre-computer objective, for said remote computing device to perform said predefined objective, said programming method comprises the steps of:

(1) specify x configuration states, at least one of said configuration states defines one or more qualifying conditions;

(2) specify y paths to be executed by said computing device;

(3) for each qualified condition of step (1), further specify a path to be executed by said computing device when a specific qualifying condition is satisfied;

(4) specify one of the qualifier configuration states to become the active configuration state;

(5) store the digital data representing the aforementioned steps in a local computing device; and

(6) download the digital data of step (5) to said remote computing device through a communication link.

36. The method of claim 35 wherein said communication link is a network.

37. The method of claim 36 wherein said network comprises of the internet; intranet extranet or LAN.

1 38. The method of claim 35 further comprising a step to direct an element of a path to
2 a program written in a second programming language of different format.

3
4 39. The method of claim 35 further comprising a step to evaluate the architecture of
5 said remote computing device and a further step to configure the aforementioned steps to
6 work with the architecture of said remote computing device.

7
8 40. The method of claim 35 further comprising a step to organize at least part of the
9 data specified by said steps into a table format.

10
11 41. The method of claim 35 further comprising a step to store digital data
12 representing said configuration states and paths into said remote computing device for the
13 execution thereof.

14
15 42. The method of claim 35 further comprising a step to transform at least part of the
16 specifications of the configuration states and the paths into a secondary programming
17 language of different format.

18
19 43. The method of claim 35 wherein the configuration states or paths are not
20 necessary to be listed in sequential relationship to each other.

21
22 44. A multiple processors computing device comprising a first processor and a second
23 processor wherein said first processor is configured to execute at least part of a table
24 format program defined by m configuration states interact with n paths.

25
26 45. The multiple processors computing device of claim 44 wherein the second
27 processor executes programs written with a second language not in table format.

28
29 46. The multiple processors computing device of claim 45 wherein the second
30 processor is configured to execute a program as directed by a table format program
31 executed by said first processor.

32

1 47. The multiple processors computing device of claim 44 wherein said first and
2 second processors are included in a single integrated circuit.

3
4 48. The multiple processors computing device of claim 44 wherein at least one
5 instruction executable by one of the processors is different from the instruction set
6 executable by the other processor.

7
8 49. The multiple processors computing device of claim 44 further comprising means
9 to pass parameter between said first and second processors.

10
11 50. A method to compose a compiler suitable for a first computing device to compile
12 a table format program having m configuration states and n paths, and to generate a
13 program suitable to be executed by a second computing device, comprising the steps of:

- 14 (1) define a table format programming specification as a pre-computer activity;
15 (2) identify the region representing the configuration states;
16 (3) identify the region representing the paths;
17 (4) identify at least one qualifying condition of a configuration state and link it
18 to the path specified; and
19 (5) link a configuration state A to a path quoting said configuration state A as
20 its element.
21 (6) generate codes suitable to be executed by said second computing device.

22
23
24 51. The method of claim 50 further comprising a procedure to integrate the function
25 of steps (1) to (4) into a compiler of an existing language.

26
27 52. The method of claim 50 further comprising a procedure in step (1) to identify a
28 keyword representing the starting of the configuration states.

29
30 53. The method of claim 50 further comprising a procedure in step (2) to identify a
31 keyword representing the starting of the paths.

32

1 54. The method of claim 50 further comprising a step to equate an user defined
2 expression with a specific instruction of the table format programming language.

3
4 55. The method of claim 54 further comprising a step to identify a table equating user
5 define expressions with predefined instruction set of table format programming language.

6
7 56. The method of claim 50 further comprising a step to identify label unexecutable
8 according to the instruction set of said table format program.

9
10 57. The method of claim 56 further comprising a step to link said unexecutable label
11 to an external program.

12
13 58. The method of claim 57 wherein said external program comprises of a program
14 composed by any available programming language including the table format
15 programming language.

16
17 59. The method of claim 50 further comprising a step to distinguish two or more
18 program groups, wherein each program group comprises of at least one configuration
19 state table and one path table.

20
21 60. The method of claim 59 further comprising a step to compile the interaction in
22 between said multiple program groups.

23
24 61. The method of claim 57 further comprising a step to define an instruction to
25 activate a program group.

26
27 62. The method of claim 61 wherein said instruction is represented by one or more
28 task tables.

29
30 63. A method to program a computing apparatus to perform in accordance to a pre-
31 computer programming objective, comprising the steps of:

- 1 (1) select a programming language having a predefined instruction set;
- 2 (2) define alternate expression to represent a specific instruction of the selected
- 3 language;
- 4 (3) compose program with said alternate expression and
- 5 (4) configure said program to be executable by said computing apparatus and
- 6 directing said computing apparatus to perform in accordance to said pre-computer
- 7 programming objective.

8
9 64. The method of claim 63 wherein the selected programming language is a table
10 format programming language comprising:

- 11 x configuration states, at least one of said configuration states defines one or more
- 12 qualifying conditions;
- 13 y paths to be executed by said computing device; and
- 14 one of the paths is executed by said computing device when a specific qualifying
- 15 condition is satisfied.

16
17 65. The method of claim 63 wherein the process of step (4) is a translation process
18 carried out by an editor, a compiler, an interpreter or a translation program.

19
20 66. The method of claim 65 further comprising the step of displaying the composed
21 program with the translated predefined instruction set of the selected language.

22
23 67. The method of claim 65 further comprising the step of displaying the composed
24 program with the user defined expressions.

25
26 68. The method of claim 63 further comprising a step to provide a table located inside
27 the program for linking said alternate expression with the corresponding specific
28 instruction.

29
30 69. A programming method to program a computing device responsive to one or
31 more virtual qualifiers, to execute one or more paths; said programming method
32 comprises the steps of:

- 1 (1) define one or more virtual qualifiers;
- 2 (2) specify x configuration states, at least one of said configuration states defines
- 3 one or more qualifying conditions;
- 4 (3) define at least one of the qualifying conditions of step (2) to represent a
- 5 virtual qualifiers;
- 6 (4) specify y paths to be executed by said computing device;
- 7 (5) for each qualifying condition of step (2), further specify a path to be executed
- 8 by said computing device when a specific qualifying condition of said qualifier is
- 9 satisfied;
- 10 (6) specify one of the qualifier configuration states to become the active
- 11 configuration state.
- 12 (7) configure said aforementioned steps into a program executable by said
- 13 computing apparatus.

14
15 70. The programming method of claim 69 wherein said computing device is defined
16 as a first computing device; said programming method further comprising a step to
17 receive digital data representing the aforementioned steps through a communication link
18 from a second computing device locating remote from said first computing device.

19
20 71. The programming method of claim 69 further comprising a step to specify one or
21 more configuration states to comprise an output configuration.

22
23 72. The programming method of claim 71 wherein said output configuration defines
24 the output conditions of one or more output terminals of said computing device.

25
26 73. The programming method of claim 71 wherein said output configuration defines a
27 virtual computing output generated by said computing device.

28
29 74. The programming method of claim 69 further comprising a step to transform the
30 specifications of the configuration states and the paths into digital data executable by said
31 computing device.

1
2 75. The programming method of claim 69 further comprising a step to transform at
3 least part of the specifications of the configuration states and paths with a secondary
4 programming language of different format.

5
6 76. The programming method of claim 69 wherein the x configuration states and y
7 paths are not necessary to be listed in sequential relationship to each other.

8
9 77. The programming method of claim 69 further comprising a step to provide a
10 keyword for identifying the location of the program composed by said steps.

11
12 78. The programming method of claim 69 further comprising a step to group the
13 configuration states of step (2) into one or more tables, and one of the configuration states
14 in each table is specified to be active.

15
16 79. The programming method of claim 69 further comprising a step to organize a
17 separated table to determine if the program composed by steps (2) to (6) is active or not
18 active.

19
20 80. The programming method of claim 69 further comprising the following steps:

21 (8) provide a predefined instruction set to program the paths and configuration
22 states;

23 (9) define alternate expression to represent a specific instruction of the
24 instruction set of step (8);

25 (10) compose program with the alternate expression and

26 (11) configure said program to be executable by said computing apparatus.

27
28 81. The method of claim 80 wherein the process of step (11) is a translation process
29 carried out by an editor, a compiler, an interpreter or a translation program.

30

1 82. The method of claim 80 further comprising a step to provide a table for cross
2 reference between said alternate expression and the corresponding specific instruction.

3
4 83. The method of claim 69 further comprising a step to specify a configuration state
5 to be active.

6
7 84. The method of claim 69 further wherein a path is defined as a default path to be
8 executed at initialization.

9
10 85. A programming method to facilitate the identification of a predetermined type of
11 custom expressions in the program listing of a computing device comprising the steps of:

12 (1) define one or more sets of custom expressions;

13 (2) equate the custom expressions of step 1 with a reference set of expressions;

14 (3) select a desirable set of expressions from a predetermined number of different
15 expression sets derived from the steps (1) and (2); and

16 (4) list said program listing with the selected expression set.

17
18 86. The programming method of claim 85 further comprising the steps of

19 (1) defining x configuration states, at least one of said configuration states
20 defines one or more qualifying conditions;

21 (2) define y paths to be executed by said computing device; and

22 (3) assign one of the paths to be executed by said computing device when a
23 specific qualifying condition is satisfied.

24
25 87. The programming method of claim 85 wherein said custom expression set is
26 defined by a table having a keyword.

27
28 88. The programming method of claim 85 wherein said predetermined expression set
29 is configured to highlight user defined labels.

30

1 89. The programming method of claim 88 further comprising a step to select one of
2 the different ways to highlight said selected custom expression set.

3
4 90. A programming method to program a computing device responsive to one or
5 more qualifying conditions, to execute one or more paths; said programming method
6 minimally comprises the steps of:

7 (1) define a programming objective;

8 (2) specify x configuration states in accordance to said programming objective
9 wherein x is an integers equal or greater than one;

10 (3) specify one or more qualifying label to at least one of said x configuration
11 states,

12 (4) directs the qualifying label of step 2 to a separated expression describing the
13 qualifying condition or conditions represented by said label;

14 (5) specify y executable paths in which at least one path is executed in response
15 to a qualifying condition specified by step (4), and

16 (6) configure said aforementioned steps into a program executable by said
17 computing apparatus to perform said programming objective.

18
19 91. A first computing apparatus connected with a second remote computing device
20 comprising:

21 computing means to execute a program; and

22 memory means storing digital data executable by said first computing apparatus
23 or said second remote computing device; wherein said digital data comprising
24 representation of a table format program having x configuration states and y paths; at
25 least one of said configuration states defines one or more qualifying conditions; and one
26 of said path is executed by said computing means when a specific qualifying conditions is
27 satisfied.

28
